

# Distributed Coverage Optimization Techniques for Improving Lifetime of Wireless Sensor Networks

PhD Dissertation Defense

**Ali Kadhum IDREES**

Under Supervision:

Raphaël COUTURIER, Karine DESCHINKEL & Michel SALOMON

University of Franche-Comté - FEMTO-ST - DISC Dept. - AND Team

**1 October 2015**

# Problem Definition, Solution, and Objectives

## MAIN QUESTION ?

How to reduce the redundancy while coverage preservation for prolong the network lifetime continuously and effectively when monitoring a certain area of interest ?

# Problem Definition, Solution, and Objectives

## OUR SOLUTION

The area of interest is divided into subregions using a divide-and-conquer method and then combine two efficient techniques :

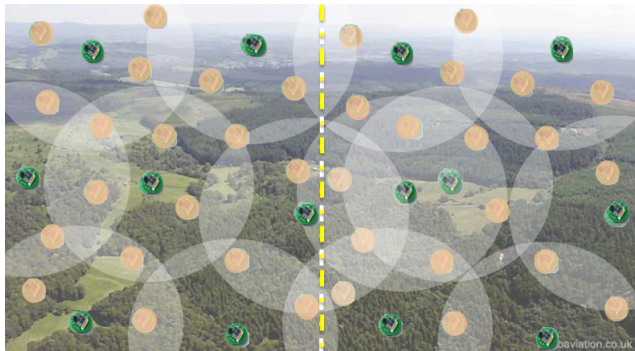

- Leader Election for each subregion.

# Problem Definition, Solution, and Objectives

## OUR SOLUTION

- Activity Scheduling based optimization is planned for each subregion.

## Dissertation Objectives

Develop energy-efficient distributed optimization protocols that should be able to :

- Schedule node activities by optimize both coverage and lifetime.
- Combine two efficient techniques : leader election and sensor activity scheduling.
- Perform a distributed optimization process.

# Presentation Outline

# Presentation Outline

---

# Wireless Sensor Networks (WSNs)

## Architecture of WSNs

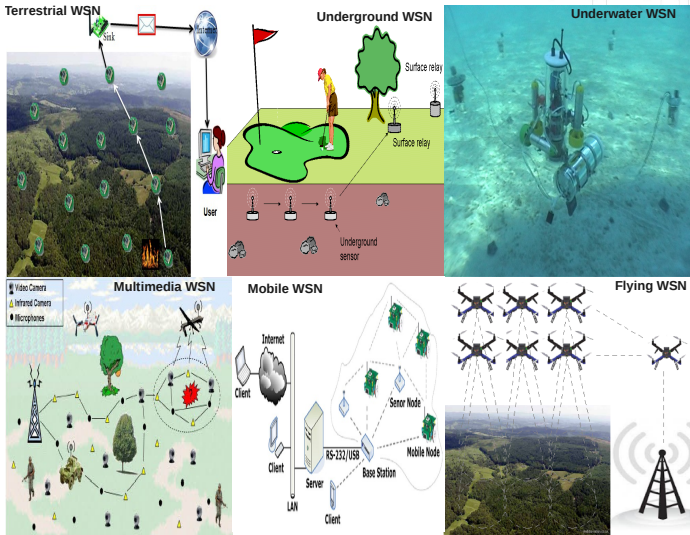

## Sensor

- Electronic Low-cost tiny device.
- Sense, process and transmit data.
- Limited energy, memory and processing capabilities.

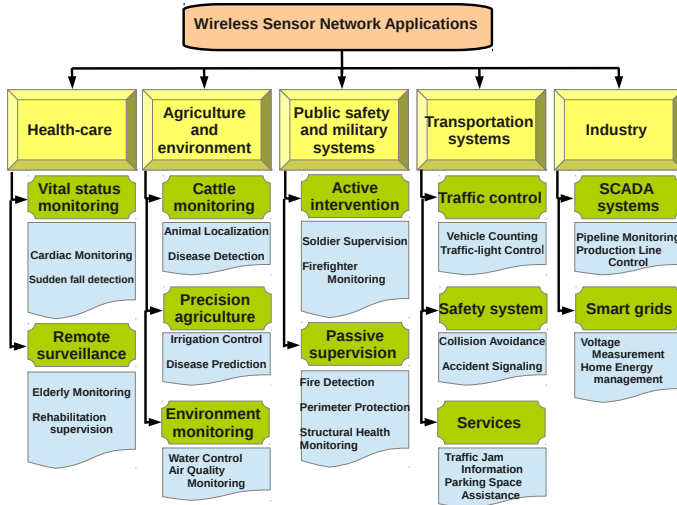

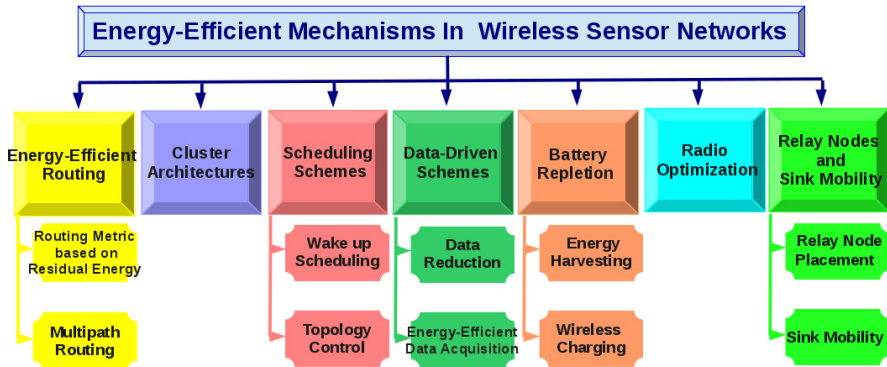

# Types of Wireless Sensor Networks

# Applications

# Energy-Efficient Mechanisms of a working WSN

# Network Lifetime

---

## Some network lifetime definitions :

- i) Time spent until death of the first sensor ( or cluster head ).
- ii) Time spent until death of all wireless sensor nodes in WSN.
- iii) Time spent by WSN in covering each target by at least one sensor.
- iv) Time during which the area of interest is covered by at least  $k$  nodes.
- v) Elapsed time until losing the connectivity or the coverage.

## Network lifetime In this dissertation :

Time elapsed until the coverage ratio becomes less than a predetermined threshold  $\alpha$ .

# Coverage in Wireless Sensor Networks

---

## Coverage Definition :

**Coverage** reflects how well a sensor field is monitored efficiently using as less energy as possible.

# Coverage in Wireless Sensor Networks

## Coverage Definition :

**Coverage** reflects how well a sensor field is monitored efficiently using as less energy as possible.

## Coverage Types :

1. **Area coverage** : every point inside an area has to be monitored.
2. **Target coverage** : is to cover only a finite number of discrete points called targets.
3. **Barrier coverage** : is to detect targets as they cross a barrier such as in intrusion detection and border surveillance applications.

# Coverage in Wireless Sensor Networks

## Coverage Definition :

**Coverage** reflects how well a sensor field is monitored efficiently using as less energy as possible.

## Coverage Types :

1. **Area coverage** : every point inside an area has to be monitored.
2. **Target coverage** : is to cover only a finite number of discrete points called targets.
3. **Barrier coverage** : is to detect targets as they cross a barrier such as in intrusion detection and border surveillance applications.

## Coverage type in this dissertation :

The work presented in this dissertation deals with area coverage.

# Existing Works

## Coverage Approaches :

Most existing coverage approaches in literature classified into

### A) Full centralized coverage algorithms.

- Optimal or near optimal solution.
- low computation power for the sensors (except for base station).
- High communication overhead.
- Not scalable for large WSNs.

### B) Full distributed coverage algorithms.

- Lower quality solution.
- High communication overhead especially for dense WSNs.
- Reliable and scalable for large WSNs.

## Coverage protocols in this dissertation :

The protocols presented in this dissertation combine between the two above approaches.

# Presentation Outline

---

## DiLCO Protocol ▶ Assumptions and Network Model :

- \* Static Wireless Sensors.
- \* Uniform deployment.
- \* High density deployment.
- \* Homogeneous in terms of :
  - Sensing, Communication, and Processing capabilities
- \* Heterogeneous Energy.
- \* Its  $R_c \geq 2R_s$ .
- \* Multi-hop communication.
- \* Know Its location by :
  - Embedded GPS or
  - Location Discovery Algorithm.
- \* Using two kinds of packet :
  - INFO packet.
  - ActiveSleep packet.
- \* Five status for each node :
  - LISTENING, ACTIVE, SLEEP, COMPUTATION, and COMMUNICATION.

### Primary point coverage model

## DiLCO Protocol ► Main Idea

### 1. **INFORMATION EXCHANGE :**

Sensors exchanges through multi-hop communication, their :

- Position coordinates,
- current remaining energy,
- sensor node ID, and
- number of its one-hop live neighbors.

### 2. **LEADER ELECTION :**

The selection criteria are, in order of importance :

- larger number of neighbors,
- larger remaining energy, and then in case of equality,
- larger ID.

### 3. **DECISION :**

Leader solves an integer program(see next slide) to :

- Select which sensors will be activated in the sensing phase.
- Send Active-Sleep packet to each sensor in the subregion.

### 4. **SENSING :**

Based on Active-Sleep Packet Information :

- Active sensors will execute their sensing task.
- Sleep sensors will wait a time equal to the period of sensing to wakeup.

## DiLCO Protocol ► Coverage Problem Formulation

Our coverage optimization problem can then be formulated as follows :

$$\left\{ \begin{array}{l} \min \sum_{p \in P} (w_{\theta} \Theta_p + w_U U_p) \\ \text{subject to :} \\ \sum_{j \in J} \alpha_{jp} X_j - \Theta_p + U_p = 1, \quad \forall p \in P \\ \Theta_p \in \mathbb{N}, \quad \forall p \in P \\ U_p \in \{0, 1\}, \quad \forall p \in P \\ X_j \in \{0, 1\}, \quad \forall j \in J \end{array} \right.$$

- $X_j$  : indicates whether or not the sensor  $j$  is actively sensing (1 if yes and 0 if not) ;
- $\Theta_p$  : *overcoverage*, the number of sensors minus one that are covering the primary point  $p$  ;
- $U_p$  : *undercoverage*, indicates whether or not the primary point  $p$  is being covered (1 if not covered and 0 if covered).

# DiLCO Protocol ► DiLCO Protocol Algorithm

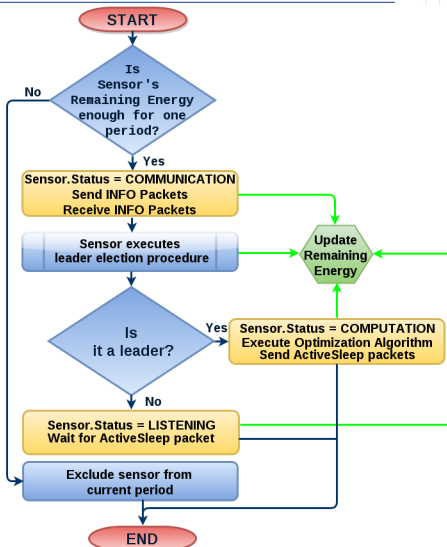

TABLE: Relevant parameters for network initializing.

Parameter	Value
Sensing Field	$(50 \times 25) m^2$
Nodes Number	50, 100, 150, 200 and 250 nodes
Initial Energy	500-700 joules
Sensing Period	60 Minutes
$E_{th}$	36 Joules
$R_s$	5 m
$R_c$	10 m
$w_\Theta$	1
$w_U$	$ P ^2$
Modeling Language	A Mathematical Programming Language (AMPL)
Optimization Solver	GNU linear Programming Kit (GLPK)
Network Simulator	Discrete Event Simulator OMNeT++

### Energy Consumption Model

<b>Sensor status</b>	MCU	Radio	Sensing	<i>Power (mW)</i>
LISTENING	On	On	On	20.05
ACTIVE	On	Off	On	9.72
SLEEP	Off	Off	Off	0.02
COMPUTATION	On	On	On	26.83
Energy needed to send or receive a 2-bit content message				0.515

### Performance Metrics

- ⇒ **Network Lifetime**
- ⇒ **Coverage Ratio (CR)**
- ⇒ **Energy Consumption**
- ⇒ **Number of Active Sensors Ratio (ASR)**
- ⇒ **Execution Time**

## MuDiLCO Protocol ► Multiround Coverage Problem Formulation

Our coverage optimization problem can then be formulated as follows

$$\min \sum_{t=1}^T \sum_{p=1}^P (W_{\theta} * \Theta_{t,p} + W_U * U_{t,p})$$

Subject to

$$\sum_{j=1}^{|J|} \alpha_{j,p} * X_{t,j} = \Theta_{t,p} - U_{t,p} + 1 \quad \forall p \in P, t = 1, \dots, T$$

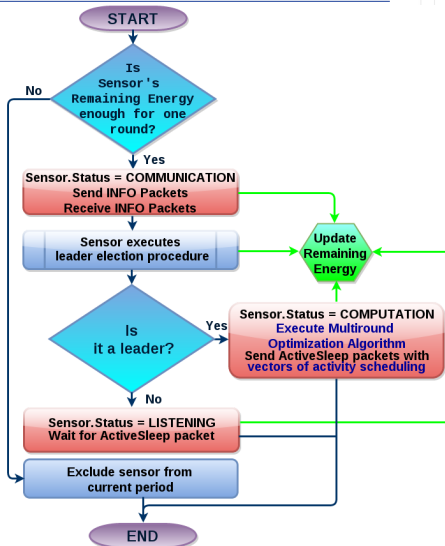

$$\sum_{t=1}^T X_{t,j} \leq \lfloor RE_j / E_{th} \rfloor \quad \forall j \in J, t = 1, \dots, T$$

$$X_{t,j} \in \{0, 1\}, \quad \forall j \in J, t = 1, \dots, T$$

$$U_{t,p} \in \{0, 1\}, \quad \forall p \in P, t = 1, \dots, T$$

$$\Theta_{t,p} \geq 0 \quad \forall p \in P, t = 1, \dots, T$$

# PeCO Protocol ► PeCO Protocol Algorithm

## PeCO Protocol ► Perimeter-based Coverage Problem Formulation

$$\text{Minimize } \sum_{j \in S} \sum_{i \in I_j} (\alpha_i^j M_i^j + \beta_i^j V_i^j)$$

Subject to :

$$\sum_{k \in A} (a_{ik}^j X_k) + M_i^j \geq l \quad \forall i \in I_j, \forall j \in S$$

$$\sum_{k \in A} (a_{ik}^j X_k) - V_i^j \leq l \quad \forall i \in I_j, \forall j \in S$$

$$X_k \in \{0, 1\}, \forall k \in A$$

$$M_i^j, V_i^j \in \mathbb{R}^+$$

$S$  represents the set of sensor nodes ;

$A \subseteq S$  is the subset of alive sensors ;

$I_j$  designates the set of coverage intervals (CI) obtained for sensor  $j$  ;

$a_{ik}^j$  is indicator function of whether sensor  $k$  is involved in coverage interval  $i$  of sensor  $j$  ;

$\alpha_i^j$  and  $\beta_i^j$  are nonnegative weights ;

$l$  is the level of coverage required for one sensor ;

$l^i$  the number of active sensors for covering the coverage interval  $i$  ;

If the sensor  $j$  is undercovered  $\Rightarrow M_i^j = l - l^i, V_i^j = 0$  ;

If the sensor  $j$  is overcovered  $\Rightarrow M_i^j = 0, V_i^j = l^i - l$ .

# Presentation Outline

---

# Conclusion

---

- ▶ Two-step approaches are proposed to optimize both coverage and lifetime performances, where :
  - Sensing field is divided into smaller subregions using divide-and-conquer method.
  - One of the proposed optimization protocols is applied in each subregion in a distributed parallel way.
- ▶ The proposed protocols (DiLCO, MuDiLCO, PeCO) combine two efficient mechanisms :
  - Network leader election, and
  - Sensor activity scheduling based optimization.
- ▶ Our protocols are periodic where each period consists of 4 phases :
  - Information exchange,
  - Network leader election,
  - Decision based optimization, and
  - Sensing.

# Conclusion

---

- ▶ DiLCO and PeCO provide a schedule for one round per period.
- ▶ MuDiLCO provides a schedule for multiple rounds per period.
- ▶ Comparison results show that DiLCO, MuDiLCO, and PeCO protocols :
  - maintain the coverage for a larger number of rounds.
  - use less active nodes to save energy efficiently during sensing.
  - are more powerful against network disconnections.
  - perform the optimization with suitable execution times.
  - consume less energy.
  - prolong the network lifetime.

# Perspectives

---

- ▶ The optimal number of subregions will be investigated.
- ▶ Design a heterogeneous integrated optimization protocol to integrate coverage, routing, and data aggregation protocols.
- ▶ Extend PeCO protocol so that the schedules are planned for multiple sensing periods.
- ▶ We plan to consider particle swarm optimization or evolutionary algorithms to obtain quickly near optimal solutions.
- ▶ Improve our mathematical models to take into account heterogeneous sensors from both energy and node characteristics point of views.
- ▶ The cluster head will be selected in a distributed way and based on local information.
